IT CONTROL CENTER | MIT | LOCAL-FIRST

Every server. One glance.

MyControlPanel is a pitch-black IT Control Center for macOS, Windows, Linux, iOS, and Android. Connect over SSH and see live metrics, cronjobs, apps, alerts, and logs refresh into one calm dashboard (manual rescan / tab switch) — plus a built-in terminal and an AI assistant that knows your fleet (bring your own key or run Ollama locally).

Live today

- Server metrics via a one-click stdlib-only agent (:9108).
- Cron / app / alert discovery over SSH; real log tail with level filters.
- Built-in SSH terminal + AI chat with fleet context.
- Live GitLab issues + MRs next to server health.

Honestly labelled

- GitHub, CI/CD timeline, Security: UI-ready, wiring on roadmap — DEMO in-app.
- Background alerts: opt-in, OFF by default, ~15 min, on-device, no push relay.
- Honest “last checked …” line — never silent; iOS may deliver hours apart.
- Desktop closed-app delivery = tray mode (Beta.2, planned — not shipped).
- Credentials in the OS keychain; no account, no tracking.
